

Abdul Hale

Quantitative Analyst

dlane@example.org | 0191 4960776 | South Marc

SUMMARY

Quantitative Analyst with 10+ years building customer-facing systems. Comfortable across Statistics, Pandas, online experimentation. Enjoys owning a problem end to end, from design through on-call.

SKILLS

Statistics • Pandas • online experimentation • ML modelling • Scikit-learn • Python 3

EXPERIENCE

Quantitative Analyst, Uber (2024 - 2026)

- Performed exploratory analysis on 3M rows of onboarding data to size a new product bet.
- Replaced a heuristic onboarding rule with a learned model, cutting false positives by 16%.
- Productionised the search scoring pipeline with 5 engineers and monitored it post-launch.

Data Scientist, IBM (2021 - 2024)

- Wrote the metric definitions and power calculations for the inventory experimentation framework.
- Segmented 1.2M customers into 11 behavioural clusters that drove the search campaign.
- Backtested the risk model on 16 historical quarters before rollout.

Quantitative Analyst, Adobe (2019 - 2021)

- Designed and analysed 24 experiments on onboarding, of which 2 shipped.
- Backtested the search model on 7 historical quarters before rollout.
- Built a gradient boosting model for inventory that improved precision by 35% over the existing baseline.
- Wrote the metric definitions and power calculations for the billing experimentation framework.
- Communicated search model limitations and failure modes to non-technical leadership.

Applied Data Scientist, Myntra (2016 - 2019)

- Segmented 600K customers into 19 behavioural clusters that drove the inventory campaign.
- Productionised the payments scoring pipeline with 5 engineers and monitored it post-launch.
- Performed exploratory analysis on 12K rows of logistics data to size a new product bet.
- Built a gradient boosting model for onboarding that improved precision by 27% over the existing baseline.
- Built causal impact estimates for the notifications launch when a clean A/B split was not possible.

Applied Data Scientist, Flipkart (2015 - 2016)

- Built causal impact estimates for the onboarding launch when a clean A/B split was not possible.
- Communicated risk model limitations and failure modes to non-technical leadership.
- Wrote the metric definitions and power calculations for the claims experimentation framework.
- Segmented 220K customers into 8 behavioural clusters that drove the payments campaign.

ACADEMICS

B.E. in Computer Engineering

Jadavpur University (2011 - 2015)

Senior Secondary (Class XII), CBSE

Delhi Public School (2009 - 2011)

CERTIFICATION

- Google Professional Data Engineer

ACADEMIC PROJECTS

Churn Prediction

Survival model predicting churn 11 weeks ahead.
