

Susan Carpenter

Senior Data Scientist

nicolemeadows@example.org | +1-494-706-5361x69243 | East Kimberly

PROFESSIONAL SUMMARY

Senior Data Scientist with 17+ years building large-scale systems. Comfortable across applied ML, causal inference, data viz. Comfortable mentoring and reviewing across a small team.

SKILLS

applied ML * causal inference * data viz * NumPy * Statistics * Python * SQL (PostgreSQL, MySQL) * scikit-learn pipelines

ACADEMIC BACKGROUND

B.Tech in Information Technology

IIT Madras (2003 - 2007)

WORK EXPERIENCE

Senior Data Scientist, Walmart (2022 - Present)

- * Communicated payments model limitations and failure modes to non-technical leadership.
- * Built causal impact estimates for the claims launch when a clean A/B split was not possible.
- * Segmented 1.2M customers into 21 behavioural clusters that drove the search campaign.

Data Scientist, Adobe (2018 - 2022)

- * Communicated billing model limitations and failure modes to non-technical leadership.
- * Replaced a heuristic billing rule with a learned model, cutting false positives by 39%.
- * Segmented 150K customers into 16 behavioural clusters that drove the billing campaign.

Data Scientist, IBM (2014 - 2018)

- * Productionised the onboarding scoring pipeline with 7 engineers and monitored it post-launch.
- * Wrote the metric definitions and power calculations for the claims experimentation framework.
- * Built causal impact estimates for the onboarding launch when a clean A/B split was not possible.

Quantitative Analyst, Flipkart (2009 - 2013)

- * Built causal impact estimates for the billing launch when a clean A/B split was not possible.
- * Performed exploratory analysis on 600K rows of claims data to size a new product bet.
- * Built a transformer model for claims that improved precision by 55% over the existing baseline.

Senior Data Scientist, Ola (2007 - 2008)

- * Communicated inventory model limitations and failure modes to non-technical leadership.
- * Wrote the metric definitions and power calculations for the claims experimentation framework.
- * Built a random forest model for risk that improved F1 by 30% over the existing baseline.
- * Built causal impact estimates for the payments launch when a clean A/B split was not possible.
- * Segmented 8M customers into 16 behavioural clusters that drove the logistics campaign.

ACADEMIC PROJECTS

Fraud Detection Model

Imbalanced classification over 1.2M transactions, 26% recall.
